Reviewer's report

Title: Double auricles of the right atrium: a unique anatomic deformity

Version: 1 Date: 27 December 2010

Reviewer: Filipoos Triposkiadis

Reviewer's report:

This is an interesting case report regarding a patient with double auricles of the right atrium, accidentally discovered during elective coronary artery bypass surgery. The paper is interesting and well written. I recommend that the authors describe in more detail the difficulties encountered in echocardiographic detection and add a relevant echocardiographic figure if available. I suspect that if this variant is difficult to detect with echocardiography it may be more common than anticipated. The number of authors is significantly greater than expected in a case report.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
