Reviewer’s report

Title: Cardiac arrest associated with Sildenafil ingestion in a patient with an abnormal origin of the left coronary artery: Case report

Version: 3 Date: 13 June 2011

Reviewer: Salah Said

Reviewer’s report:

In this manuscript the authors present a case of 59-year-old male with cardiac arrest after sexual intercourse and Sildenafil ingestion associated with congenital anomalous origin of the left coronary artery from the right sinus of Valsalva. The manuscript is well written and elaborates a very interesting topic.

Minor essential revision:
Case presentation:
Page 3: Line 8: "cardiac" seems to appropriate instead of "coronary" enzymes ......
Page 4: Line 8: Was proximal ligation of the left anterior descending performed to prevent competitive flow?
Page 4: Line 13: "erectile dysfunction" seems appropriate than "impotence"

Conclusion:
Page 5: Line 7: "und" --> "and"

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
