Reviewer’s report

Title: Correlations between prescription of anti-hypertensive medication and mortality due to stroke

Version: 1 Date: 20 November 2011

Reviewer: Fabio Angeli

Reviewer’s report:

The main aim of the analysis proposed by Papp and co-workers was to find correlations based on Hungarian data on stroke-mortality and on prescription routine of anti-hypertensive therapeutics.

The manuscript is well written and the topic is intriguing.

I invite the Authors to expand the description of the results.

In addition, statistical methods should be more clearly detailed and the prognostic impact of different blood pressure lowering regimens was not formally investigated. Please, add data.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, and I have assessed the statistics in my report.
