Reviewer's report

Title: Vagal baroreflex activation resulting in acute coronary stent thrombus associated with myocardial infarction: a case report

Version: 3 Date: 9 July 2014

Reviewer: Ahmed Dr Mahmoud

Reviewer's report:

Major Compulsory Revisions:
- Authors need to clarify why they tested for CYP450 before and after the PCI.
- "After the stenting procedure, the thrombolysis in myocardial infarction (TIMI) grade was 0, and no cineangiographic characteristics of thrombus were present." I believe the authors mean TIMI III not 0 as 0 means no flow.
- "A balloon was placed at the location where the thrombi adhered." This statement needs further clarification what do the authors mean by balloon? IABP or intracoronary balloon. Also, what they meant by thrombi? is it in the aorta or the coronaries?

Discretionary Revisions:
- The manuscript is too large for a case report (9 pages), the authors need to be more concise and try to provide the same information with less words. For example: "The chest pain occurred mostly when he did heavier jobs and was relieved when he took nitroglycerin or rest. However, over the past 2 years, the patient noticed that the chest pain had been occurring with increasing frequency and without any cause" can be summarized to "chronic stable angina with accelerating angina over the past 2 years".

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
