Reviewer’s report

Title: Duration of Dual Antiplatelet Therapy Following Percutaneous Coronary Intervention on Re-hospitalization for Acute Coronary Syndrome

Version: 1 Date: 18 September 2013

Reviewer: James DiNicolantonio

Reviewer’s report:

Minor revisions
1.) Please fix spelling and grammatical errors throughout manuscript
2.) Please address limitation of Taiwanese response to Clopidogrel vs. other populations (CYP2C19*2 prevalence)
3.) Was there use of cilostazol and if so did this affect the outcome
4.) In limitations it must be addressed that patients that discontinue any medication are generally at a higher risk of CV events (i.e. they are sicker) and thus reverse causation could be leading to these results - please emphasis this in the conclusions.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
