Reviewer's report

Title: Do gender differences in primary PCI mortality represent a different adherence to guideline recommended therapy? A multicenter observation.

Version: 2 Date: 29 April 2014

Reviewer: Stefano Pidello

Reviewer's report:

Discretionary Revisions
1. Since in the paper it is discussed about the difference in beta-blocker and statin use between genders it could be relevant to present simple clinical data such heart rate, blood pressure and LDL levels and to analyze if there is any difference in baseline levels between genders.

I think this could be helpful and could give some more suggestion in the discussion of results, as has been well done for antiplatelet treatment.

Minor Essential Revisions
2. Reference number 4. The first author's correct surname is D'Ascenzo.

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
