Reviewer's report

Title: Tranexamic acid for patients with traumatic brain injury: a randomized, double-blinded, placebo-controlled trial.

Version: 3 Date: 3 July 2013

Reviewer: Robert Hoesch

Reviewer's report:

The article is improved and has addressed my concerns, but those concerns still remain:

1. The conclusions state that there is a substantial reduction in PIH, but really since it is not statistically significant, it is really just a "trend" towards significance. I would state it this way.

2. The article still needs fairly extensive editing for punctuation and grammar although it is improved.

3. I would include the exclusion of coagulopathy as a limitation and also as a point of further research. I would also highlight the lack of thrombotic side effects more since that is a real positive conclusion of this well-defined study.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
