Reviewer's report

Title: Variable selection under multiple imputation using the bootstrap in a prognostic study

Version: 4 Date: 16 April 2007

Reviewer: Patrick P Royston

Reviewer's report:

General

-----------------------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

-----------------------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

On page 15, you state "Austin & Tu [13] proposed the use of bootstrapping methods in combination with backward selection". This approach was suggested more than a decade earlier, by Sauerbrei & Schmacher (1992) [14], and should I feel be attributed to them, not to Austin & Tu.

The word "barrel" in the revised version is not understandable. I suggest "channel".

-----------------------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept after minor essential revisions

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
