Reviewer's report

Title: The chlamydia knowledge, awareness and testing practices of Australian general practitioners and practice nurses. Survey findings from the Australian Chlamydia Control Effectiveness Pilot (ACCEPt).

Version: 1
Date: 20 October 2013

Reviewer: Paul Van Royen

Reviewer's report:

Minor essential revisions
1. In the abstract the p-values are $p < 0.001$ whereas in table 2 it is always $p < 0.01$. Please make this consistent
2. In the abstract you stress the fact that PNs would offer testing opportunistically more often than GPs- including important risk groups- but it would be more balanced to mention that they also offer this opportunistic screening too broad - in all the asymptomatic non-sexual health scenarios presented - for instance in young men (70 vs 22 %) and in young women for pill prescription (45 vs 17 %)
3. Did the non-respondents for instance in the GP sample produce some bias. Please give some comment on this in the discussion section
4. Give one time the full text of the acronym MSM (men who have sex with men)

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
