Reviewer's report

Title: Determinants of Adult Vaccination at Inner City Health Centers: A Descriptive Study

Version: 1 Date: 27 September 2005

Reviewer: Gerrit A A van Essen

Reviewer's report:

General
This is a well designed, well performed study on an important preventive issue. The authors describe the results in a clear way. This kind of work has been done before, though, so there is no much news in it (except the racial changes over the years?)

-----------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)
Hardly any problem with the article. Minor comment is that the low response rate should have lead to a non-response analysis, which seem possible with the data available within the health center. Further is the description of the tables rather lengthy. Mentioning all the not adjusted ORs is hardly informative.

-----------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

-----------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

What next?: Accept after minor essential revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No
