Version: 1 Date: 24 Oct 2001

Reviewer: Prof Sender Miszputen

Level of interest: A paper whose findings are important to those with closely related research interests

Advice on publication: Accept without revision

It is a good and actual paper, that may interest gastroenterologists dedicated to inflammatory bowel diseases study.
The text is well written, clear and contains all details about this Crohn's disease complication.
I think the paper major message is to alert specialists about pulmonary disease associated with CD, even without symptoms. This complication may not be so rare and further pulmonary investigation will demonstrate its real frequency.
