Title: Chlamydia trachomatis antigens in enteroendocrine cells of the small bowel in patients with irritable bowel syndrome

Version: 2 Date: 29 December 2009

Reviewer: Mark Pimentel

Reviewer's report:

I have one more request from the authors. They previously published in a small number of IBS subjects that they showed myenteritis (less than 10 patients). Now that they have dozens of patients, they should show the results of their original hypothesis in this larger group. Are their results from previous study holding up in this large population. My guess is that they are not since they do not reveal those results here.
