Reviewer's report

Title: A Prospective Experimental study of liver fibrosis with ultrasound and Its Correlation with hepatic reserve function and hemodynamics

Version: 3 Date: 27 July 2012

Reviewer: Nigel Bird

Reviewer's report:

The p value given for the ALT vs HCl seems to be wrong. The authors state that the results were not significant but give a p value of 0.012 which does indicate significance. Figure 8 also has the same value on it but there is clearly no significant correlation.

The legend to Table is confusing and suggests that 11 animals with F1 were sacrificed at 8 weeks and none after that. Could I suggest "Stage of liver fibrosis at different time intervals." or something like that.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
