Reviewer's report

Title: Limited utilization of serologic testing in patients undergoing duodenal biopsy for celiac disease

Version: 3 Date: 11 September 2013

Reviewer: Raffaella Nenna

Reviewer's report:

Major Compulsory Revisions:
1. As Authors affirmed: “the proportion of biopsies from bulb vs. other duodenal locations cannot be accurately determined”. This could lead to missed diagnosis. This implies a limitation of the study that should be reported in the conclusions.
2. Introduction: page 3, lines 11-20. The three types of testing are neither “SEQUENTIAL” steps, nor “options”. I believe that “tools” is a valid term.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
