Reviewer's report

Title: High prevalence of Helicobacter pylori Infection in Behcet's Disease

Version: 2 Date: 9 January 2014

Reviewer: Seray Külcü Çakmak

Reviewer's report:

The article describes the prevalence of H. pylori infection identified by serology and urea breath tests. The authors state that previous studies had some limitations in their methodologies, but it is stated in other studies that the patients were not using drugs which might have effected the results. The authors also state that researchers from Turkey did not find any relation between deep vein thrombosis and H.pylori infection in BD, but there are other studies describing whether any specific presentation of BD is related to H.pylori. Also the English of the manuscript is poor.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: Yes, but I do not feel adequately qualified to assess the statistics.
