**Level of interest:** A paper whose findings are important to those with closely related research interests

**Advice on publication:** Accept after discretionary revisions

This paper reports on a case of mediastinitis complicating a percutaneous endoscopic gastrostomy (PEG). This is a rare complication of PEG and so far it has not been described in the literature. It is an interesting and well written paper.

Compulsory revisions:
A figure with the CT scan findings should be added in order to demonstrate the mediastinitis and its relation to gastrostomy tube.
