Title: The EQ-5D (Euroqol) Is A Valid Generic Instrument For Measuring Quality Of Life In Patients With Dyspepsia

Version: 1 Date: 6 January 2009

Reviewer: Jan JV Busschbach

Reviewer’s report:

This is a very nice written, helpful article about the validity of the EQ-5D in Dyspepsia. It not really a 'breakthrough' in research, but it will serve a notable place in the literature, as all who will use the EQ-5D in Dyspepsia hereafter will refer to this article investigating the validity (there is indeed no article that examine the validity of the EQ-5D in Dyspepsia).

I like the way the authors have written a condense manuscript, without missing the mean and critical; points in this kind of research. My suggestion would be to accept the article as it is.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

I am a member of the EuroQol group, and the EuroQol group reimburses research and related travel, including mine. My salary does not depend in anyway to the goods or bad of the EQ-5D.
