Reviewer's report

Title: Risk of myocardial infarction in parents of HIV-infected individuals: a population-based cohort study.

Version: 2 Date: 8 April 2010

Reviewer: Esteban Martinez

Reviewer's report:

This article assessed the risk of myocardial infarction in parents of HIV-infected adults through a nation-wide, population-based study. The rationale is well-reasoned and the hypothesis deserves consideration. The design of the study is exquisite. a study of this kind may be very difficult or impossible to perform in other settings, and this represents an added value. The article is well-written and it will be important in the field of cardiovascular disease in HIV-infected patients.

I have been very satisfied reviewing this article.

I have no other comment than congratulate the authors for their great hypothesis and their job.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
