Reviewer's report

Title: Knowledge, Attitudes and Practices KAP related to the Pandemic (H1N1)

Version: 2 Date: 27 December 2010

Reviewer: Onno de Zwart

Reviewer's report:

The authors have thoroughly revised their manuscript and substantial improvements have been made. My comments have all been answered. The additional multi-logistic regression analyses which have been made give relevant additional information.

There remain, however, some comments. They are not major compulsory revisions, but I think they warrant some attention especially in the discussion of the manuscript.

- Although statistical significant effects are shown, some of them are relatively small (e.g. OR of 1,07 for survey in model 1 and OR of 1,12 for educational level in model 4). This should be mentioned in the discussion because these effects should not be overstated.

- On page 15 it is stated that because of the effect of the government policy risk perception decreased over time. I think this is too strong as no causal link can be proved. There might be an effect of government policy but it also might be the effect of more attention in the media which showed the effects of the epidemic were rather mild.

- Although the English is improved I think it is important to have it corrected by a native English speaker to make it more accessible.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

I declare that I have no competing interests.
