Reviewer's report

Title: Overwhelming Postsplenectomy Mycoplasma Pneumoniae Infection in an Adult with Hypersplenism Associated with Hepatitis B Cirrhosis: Case report

Version: 1 Date: 24 February 2011

Reviewer: Kazuhiro Hanazaki

Reviewer's report:

Major comments:
1) Is it truly patient with OPSI? What is the exact reason that this patient is defined as OPSI?
2) What is reason that this OPSI is caused by mycoplasm pneumonia?
3) Author demonstrates that this is the first case report that OPSI due to mycoplasma pneumonia is supposed strongly. Autopsy is performed or not? If not so, why?

Minor comments:
1) Vaccine immunoprophylaxis preventing splenectomized patient from streptococcus pneumoniae is performed or not? If not so, why?
2) Author should reveal CT findings of splenomegaly as an figure.
3) Quality of written English is not so good. Final check by native speaker should be needed.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
