Reviewer’s report

Title: Hepatitis C prevalence in Denmark - a capture-recapture estimate based on multiple national registers

Version: 2 Date: 11 May 2012

Reviewer: Matthew Hickman

Reviewer’s report:

The authors have responded fully to the comments, and made improvements to the manuscript. The discussion outlines more clearly the potential limitations and problems. I do wonder, however, about the emphasis on capture-recapture (CRC) as suggested by the title. It seems to me that the CRC is used simply to adjust for potential under-reporting of HCV diagnoses. Thereafter, the estimation of the number of people who may be chronically infected relies on a series of other assumptions relating to % of target population diagnosed, and then estimates of HCV prevalence in target population and % untested.

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
