Reviewer's report

Title: Two stages PCR assay for detection of human brucellosis in endemic area

Version: 4 Date: 30 January 2013

Reviewer: Stephen Mshana

Reviewer’s report:

Reviewer 2
Major compulsory revision
The authors have adressed most of the comments but still not clear what was the research question and type of the study. Is the method working when compared to other methods? What is the sensitivity and specificity of the method? How did you confirm Brucellosis?

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
