Reviewer's report

Title: Male Circumcision and Prevalence of Genital Human Papillomavirus Infection in Men: A Multinational Study

Version: 1 Date: 11 September 2012

Reviewer: Philip Castle

Reviewer's report:

Major Compulsory Revisions: None

Minor Essential Revisions:

1. Change in the title the word from Genital to Penile.
2. Abstract. Remove the word “reduced” from the first sentence in results.
3. Abstract. Switch from inverse to negative in the second sentence in results
4. Abstract. In the conclusions, the authors mention an inverse association of MC with number of non-oncogenic HPV types but do not present those data in the results. They only present the association with any non-oncogenic HPV type.
5. Abstract. In the conclusions, it is not clear what the authors mean by underestimated by not measure HPV from the glans and how that would change the findings (association with MC). Are they suggesting the effects would be differential by MC Status? If so, they need to make this clearer.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.

Declaration of competing interests:
