Reviewer's report

**Title:** Recurrent wheezing is associated with intestinal protozoan infections in Warao Amerindian children in Venezuela: a cross-sectional survey

**Version:** 1  **Date:** 2 December 2013

**Reviewer:** Hanspeter Marti

**Reviewer's report:**

The authors present an interesting study, which is carried out well, written fluently and well presented. Although the exact relationship between protozoal infection and recurrent wheezing remains to be established also in other settings, the study is well worth publishing.

I have only few comments for minor revisions:

1. A reference for the ethical clearance should be included, not just a general statement
2. A table detailing the parasitological findings would be interesting, as most epidemiological studies focus only on helminths and data on protozoa are very scarce
3. lamblia should be consequently written in miniscules.

**Level of interest:** An article whose findings are important to those with closely related research interests

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.

**Declaration of competing interests:**
