Advice on publication: Accept after discretionary revisions

Title:
Chlamydia trachomatis infection in early neonatal period.

Comments:
This paper reports on five cases of presumed early C. trachomatis infection in the neonatal period. The authors provide information on 5 infants admitted to their neonatal intensive care unit from January 1995 to December 2001. The paper is much improved after the author's revision. The investigators have adequately addressed most shortcomings of the manuscript.

Discretionary revisions:
1- State the number of infants admitted to the neonatal unit during the study period and the number screened for C. trachomatis.
2- Minor editorial revisions of the written English (i.e. some statements are in the present tense and others in the past tense)

Competing interests:
None declared.
