Title: Frequent detection of Bocavirus DNA in German children with respiratory tract infections

Version: 1 Date: 24 May 2006

Reviewer: Mamdoh Meqdam

Reviewer's report:

General
The manuscript concerning the new detection of Bocavirus alone or along with other respiratory tract infecting agents is interesting and shed light into a new agent causing RTI apart from the traditionally known viruses causing RTI. The manuscript is well written and prepared. I hope this study will open the way into other researches concerning the role of Bocavirus in RTI and the association of this virus with other viruses found in the same specimens.

One suggestion, I prefer that the authors change the percentages in T4 with decimal (Put the exact numbers) as that in T1&2 and along the manuscript to maintain consistent in the whole manuscript.

I recommend acceptance of the manuscript for publication in the MioMed Central
