Reviewer’s report

Title: Pseudomonas aeruginosa in a neonatal intensive care unit: molecular epidemiology and infection control measures

Version: 1 Date: 20 February 2009

Reviewer: Tim Eckmanns

Reviewer’s report:

This study shows once more that surveillance and hand disinfection are the major points of hospital infection control.

Major Revisions:
1) It would be very interesting to have some data on changes in compliance with hand disinfection or at least information about changes in disinfectant use.

Minor Revisions:
2) The authors talk about hand washing, I think they mean hand disinfection. In this case they should clarify this and give a definition of what is meant by hand disinfection.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
