Reviewer’s report

Title: Herlyn-werner-wunderlich syndrome: MRI findings, radiological guide (two cases and literature review), and differential diagnosis

Version: 2 Date: 24 October 2011

Reviewer: Abu Obaidah

Reviewer’s report:

I agree with your comment that MRI is an essential investigation for diagnosing MDA, not only diagnosing but it also help to know which type of defect it is and help in classifying according to American Society for Reproductive Medicine (ASRM) classification of Müllerian duct anomalies. It also help in diagnosing other associated anomalies like in theses cases renal anomaly. Therefore MRI should done before laparoscopy as it help in planning the management before hand.

Minor Essential Revisions- in Patient 1 report last paragraph you forgot to write kidney (last word)

Discretionary Revisions- Author would have added what treatment they had undergone as it had further stressed the importance of MRI in differentiating these two type of anomalies.

Level of interest: An article of importance in its field

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
