Reviewer's report

Title: Right-sided congestive heart failure symptoms in patients with extensive pulmonary sarcoidosis

Version: 1 Date: 13 October 2012

Reviewer: Ryan Aleong

Reviewer's report:

Major (would make these changes to better discuss the role of cMRI in cardiac sarcoidosis)
1. Need to discuss limitations of cardiac MRI, such as potential difficulty of determining if delayed enhancement is present vs. artifact given then RV wall.
2. The authors briefly mention that inflammation can be detected but should mention which MRI modality is used to detect inflammation vs. fibrosis.
3. The authors mention that cMRI is more sensitive than any other technique for which should be provided if this is true.
4. Briefly mention how cMRI complements PET scans

Minor: none

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:

I do not believe that I have any competing interests. My colleagues do perform research in this area but I do not believe that this represents a competing interest.
