Title: Sentinel nodes identified by computed tomography-lymphography accurately stage the axilla in patients with breast cancer

Version: 2 Date: 17 November 2013

Reviewer: weijun peng

Reviewer's report:

Dear author:
I have read your answers for my review, and most of them were satisfied. However, how to choose your patients was puzzling me—only clinical T1-2 breast cancers and clinically negative nodes who underwent sentinel node biopsy? How about the sits of the tumor, the fat condition of the patients? Our group had had the similar study, and sentinel node was difficult to appear on CT-LG images of fat patients in our study. I am just discus this point with you, and it is just our own experience; you can ignore it if you have no interest. If you have the interest, you could read the article about our study that i have attahed. Thanks!

Minor Essential Revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.

Declaration of competing interests:
