Reviewer's report

Title: Thyroid Shields and Neck Exposures in Cephalometric Radiography.

Version: 2 Date: 30 May 2006

Reviewer: Keith Horner

Reviewer's report:

General

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)
Please address points 1 and 3 (Major compulsory revisions) of my previous report.
I still do not understand why the collimation is dictated by the film orientation in your centre. This cannot be typical, surely. It is normal practice to collimate to the area of diagnostic interest, not to the film.

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)
None

Discretionary Revisions (which the author can choose to ignore)
None

What next?: Unable to decide on acceptance or rejection until the authors have responded to the major compulsory revisions

Level of interest: An article of limited interest

Quality of written English: Acceptable

Statistical review: No
