Reviewer’s report

Title: Association between UCP2 polymorphism A55V and risk of cardiovascular events in patients with multi-vessel coronary arterial disease.

Version: 2 Date: 27 July 2012

Reviewer: Vicky Cameron

Reviewer’s report:

The Revised manuscript is very much improved and the authors have addressed all of the major comments I raised.

The Introduction is now much more concise and the Methods have been amended to describe vital aspects of the study design that were omitted previously, in particular classification criteria for glycaemic status, rationale for grouping Ala/Ala and the Ala/Val genotypes. A section on strength and limitations of the study has now been included in the Discussion.

The style of English writing has greatly improved, although is still non-colloquial in parts and could be improved further. The journal editors may need to provide some guidance here if the manuscript is accepted.

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
