Reviewer's report

Title: TM4SF10 gene sequencing in XLMR patients identifies common polymorphisms but no disease-associated mutation

Version: 2 Date: 26 July 2004

Reviewer: Maria G Miano

Reviewer's report:

General
Dear Editor,
I have examined the revised manuscript Christophe-Hobertus et al. The authors have done additional changes in response to my comments. Based on this revision I evaluate the paper suitable for publication in “BMC Medical Genetics”.
Moreover, I recommend to improve table 4 with a more clear legend because it is unknown what is the first column (add “patient”), what is each number in the title of successive columns (the first is the nucleotide position of cDNA and the second is the nucleotide position of genomic DNA).

Best Regards
Maria G Miano

-------------------------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

-------------------------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

-------------------------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

-------------------------------------------------------------------------------------------------

What next?: Accept without revision

Level of interest: An article whose findings are important to those with closely related research interests
