Reviewer's report

Title: The GABBR1 locus and the G1465A variant is not associated with temporal lobe epilepsy preceded by febrile seizures.

Version: 1 Date: 10 February 2005

Reviewer: Giuseppe Capovilla

Reviewer's report:

General
This is a very interesting paper that adds new data about the genetics of epilepsy. This paper is well done and I do not raise major objections to it.

--------------------------------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

--------------------------------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)
There are some misprints (results is not heavy typed contrarily to methods, MA et al should be on the right near to the number page) and commas are not always well placed.
--------------------------------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)
The authors should indicate which MRI methodology was used to exclude the presence of lesional TLE in their cases.

What next?: Accept after discretionary revisions
