Reviewer's report

Title: Macrocytosis may be associated with mortality in chronic hemodialysis patients: a prospective study

Version: 2 Date: 14 April 2011

Reviewer: Marlies Noordzij

Reviewer's report:

I think that the manuscript has improved considerably and have only one additional, minor comment:

Now that the authors have summarized the separate comorbidities in one score, it would be informative to explain shortly how the Charlson-age comorbidity index (CACI) can be interpreted. How is the score calculated and what are minimum and maximum values? This information is necessary to be able to interpret the results.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: Yes, and I have assessed the statistics in my report.
