Reviewer's report

Title: Anti-hLAMP2-antibodies and dual positivity for anti-GBM and MPO-ANCA in a patient with relapsing pulmonary-renal syndrome.

Version: 1 Date: 1 February 2011

Reviewer: Abraham Rutgers

Reviewer's report:

The authors report on a patient with a pulmonary renal syndrome who is not only anti-GBM positive, but also ANCA positive. This is a rare but pathologically interesting observation and has been previously published. New in their data is the positivity for hLAMP2 as well. This very intruiging new autoantibody in AAV has been characterized by the same group and could help understand the development of AAV by molecular mimicry with bacterial proteins. The finding would have been even more relevant if hLAMP2 positivity could have been demonstrated also in the first presentation of the disease.

Level of interest: An article of importance in its field
