Title: Exsanguination of a home hemodialysis patient as a result of misconnected blood-lines during the wash back procedure: A case report

Version: 1 Date: 6 February 2012

Reviewer: Elias Thodis

Reviewer’s report:

This complication in the course of a home dialysis modality is reported for the first time in the literature. The authors provide a clear description of events and a concise outline of the complication.

In light of the recent rapid increase of patients with ESRD on home dialysis, this study provides very important information.

The instructions in the conclusions section contribute to prevention and avoidance of similar complications.
