Reviewer’s report

Title: Renal function evaluation in patients with American Cutaneous Leishmaniasis after specific treatment with pentavalent antimonial

Version: 2 Date: 29 March 2012

Reviewer: Ivan Velez

Reviewer’s report:

Thanks a lot to the authors for the inclusion of a control group, but I remain a little confused with the answers to my questions because if all the patients were immunocompetents and all them had had ulcerative lesions the MST positivity must be more than 90% and fever, arthralgias and myalgia are not symptoms associated to American cutaneous leishmaniasis. A more comprehensive explanation is needed.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
