Reviewer’s report

Title: Post-transplantation encapsulating peritoneal sclerosis without inflammation or radiological abnormalities

Version: 1 Date: 31 May 2013

Reviewer: Angela Summers

Reviewer’s report:

Thank you for inviting me to review this interesting case report which describes occurrence of fulminant EPs in a patient post transplantation. The most interesting aspect of this case is the fact that the CT scan did not show characteristic features of EPS. Guidelines currently recommend that EPS is diagnosed in the context of the CT scan and GI symptoms. This report is important as this patient did require surgical intervention and it highlights the need for this. This is an important message for clinical management as delays in surgical intervention can result in poor outcome.

I have only minor comments - the authors stress that inflammation was not present. This is not always a characteristic of EPS at diagnosis but it is noteworthy.

A few grammatical errors
Page 3 line 9 should read "The" patient.....
Page 6 line 4 should read "The" patients.....
Page 7 line 17 should read "The" patient...

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Needs some language corrections before being published

Statistical review: No, the manuscript does not need to be seen by a statistician.
