Reviewer’s report

Title: Post-transplantation encapsulating peritoneal sclerosis without inflammation or radiological abnormalities

Version: 1 Date: 10 June 2013

Reviewer: Titus Augustine

Reviewer’s report:

This case reflects a subtle presentation of encapsulating peritoneal sclerosis which may be more prevalent than what literature describes.

It may perhaps have been useful to repeat the laparoscopy before the laparotomy to inform the patient about the morbidity and mortality associated with enterolysis clearly.

It is interesting that a diagnosis of PTLD was not considered.

Perhaps the message should be that EPS should be considered as a differential rather than that a Laparotomy should be done in these cases.
