Title: Do We Need a Different Organ Allocation System for Kidney Transplants When Using Paired Kidneys From Donors After Circulatory Death?

Version: 1 Date: 9 February 2014

Reviewer: adriano peris

Reviewer's report:

The article by Dr. Benaragama and Coll. is a topic of primary importance, very often treated with embarrassment in the various contexts of transplantation in Europe. The process of organ donation and transplantation renal transplant activity is the most difficult to manage because the donation generally provides, in contrast to other organs, the transplantation of two organs from the same donor with the activation of a single path to the outside. Being not very widespread in Europe with the procedure of organ perfusion waiting to transplant the organ, the article by Benaragama, also involving an area so extensive as that of London, provides Centers kidney transplant indications very important, especially in relation to organizational convenience to avoid assigning two kidneys at the same transplant center: it is therefore preferable, as a rule, select two different transplant centers to reduce cold ischemia times for the second kidney from a DCD donor. The article is interesting and acceptable for publication.

Level of interest: An article of outstanding merit and interest in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
