Reviewer’s report

Title: Prospective memory tasks: a more sensitive method for screening cognitive impairment in ALS?

Version: 3 Date: 6 August 2012

Reviewer: judith aharon-peretz

Reviewer’s report:

1. Strict English editing

2. Shortening of the Introduction paragraph

3. In the Methods paragraph: patients with severe depression and anxiety were excluded. As these symptoms may contribute to impairment of the executive functions, and even be a manifestation of the executive functions impairment, I suggest to add a sentence in the summary mentioning this as a limitation.
