Reviewer's report

Title: Etanercept may induce neurosarcoidosis in a patient treated for rheumatoid arthritis

Version: 3 Date: 21 November 2013

Reviewer: HIROKI WAKABAYASHI

Reviewer's report:

This may be an exceptional and second case of neurosarcoidosis occurring in a RA patient treated with etanercept. The third cases treated with TNF inhibitor will be reported if definite or probable neurosarcoidosis. The manuscript is very interesting. But some precisions are necessary.

P6, line15” As in our case, it is not always possible to obtain histological confirmation but strong and converging arguments can lead to the diagnosis.” Why strong and converging arguments can lead to the diagnosis? Which in serum or CSF was an increased level of ACE?

Please show that what criteria was diagnosed as definite or probable neurosarcoidosis.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
