Reviewer's report

**Title:** Heat Stroke Presenting with Encephalopathy and MRI Findings of Diffuse Cerebral Injury and Hemorrhage

**Version:** 3  **Date:** 20 March 2013

**Reviewer:** Satoshi Yamashita

**Reviewer's report:**

**Major Compulsory Revisions:**
Heat stroke is defined as a core body temperature that rises above 40°C and that is accompanied by hot, dry skin and central nervous system abnormalities such as delirium, convulsions, or coma. As far as the authors do not show a direct evidence that the core body temperature was above 100 degree, the authors should not use the term of heat stroke. The authors should restate it in different terms, such as heat stress, and so on.

**Level of interest:** An article of importance in its field

**Quality of written English:** Acceptable

**Statistical review:** No, the manuscript does not need to be seen by a statistician.

**Declaration of competing interests:**
