Reviewer's report

Title: Acute transient freezing of gait in a patient with posterior reversible encephalopathy syndrome

Version: 1 Date: 15 April 2013

Reviewer: Giacomo Koch

Reviewer's report:

This is a very interesting case report describing the case of a 43-year-old man, who had undergone hemodialysis therapy for chronic renal failure that developed freezing of gait associated with vasogenic edema in the bilateral basal ganglia caused by posterior reversible encephalopathy syndrome. The case is well described and provides a nice radiological follow-up.

Level of interest: An article of importance in its field

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
