Reviewer's report

Title: Symptomatic Hyponatremia after Lateral Medullary Infarction

Version: 4
Date: 8 February 2014
Reviewer: Amir. M Torabi

Reviewer's report:

Major compulsory revisions:
1. Treatment of SIADH is fluid restriction not salt restriction. It was mentioned twice in article as salt restriction.
2. MRI of brain, second figure does show another hyperintense DWI signal at right lateral cerebellum. This does not seem to be an artifact. There was no comment about it. Also, the author may mention if ADC map was performed to correlate with the second lesion.

Minor Essential Revision:
1. It may be helpful if we know patient had history of alcohol abuse or no, since that may predispose to hyponatremia in the first phase.
2. Authors may explain why we do not see hyponatremia in most patients with Walenberg syndrome. There should be other reason(s) in this patient predispose him to CSW.

If, in fact, he had more than one stroke (seen based on MRI), is that contributing to his solve this problem?

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No, the manuscript does not need to be seen by a statistician.
