Title: Subarachnoid hemorrhage secondary to a ruptured middle cerebral aneurysm in a patient with osteogenesis imperfecta: A case report

Version: 2 Date: 5 March 2014

Reviewer: Chandrasekaran Kaliaperumal

Reviewer's report:

Dear Authors,

I read your article with much interest. Congratulations. It is well written. You are trying to establish a point that Osteogenesis Imperfecta 1A can have saccular aneurysm causing SAH. This is already available in literature. Apart from the anatomical location this mirrors the recently published case report.

The clinical diagnosis is mainly based on the signs in this patient and one may argue that the differential could include Ehlers Danlos syndrome. I acknowledge the fact that the management of the patient is by clipping rather than endovascular route.

As you have mentioned it is difficult to ascertain the fact that whether OI has predisposed this patient to have an aneurysm and its subsequent rupture.

I do not think that this article will add more to the literature.

Best wishes.
