Re-review of the paper:
Relations of low contrast visual acuity, quality of life and multiple sclerosis functional composite: a cross-sectional analysis

Authors:
Schninzel et al.

This is an interesting and innovative paper on important theme. From statistical point of view, it is nicely done and carefully written. It correctly uses modern GEE (generalized estimating equations) approach to adjust for intra-subject correlation between the measurements of the two eyes of the same person. Interpretation of the results and formulation of the conclusions is appropriate (and modest).

The paper should be published. From statistical viewpoint, there is no need for revisions.
