Reviewer's report

Title: Posttraumatic supracubital perineurioma misdiagnosed as carpal tunnel syndrome, a case report

Version: 1 Date: 5 October 2004

Reviewer: A Lee Dellon

Reviewer's report:

I think that this is acceptable as a case report, however the evidence for trauma is minimal.

- The injection site was not near the tumor
- There is clearly a neoplasm
- The report is good enough without the trauma
- The patient simply is recalling the pain from the injection
- There is no evidence that procaine can cause a tumor

Delete the word post-traumatic from the title.

Also, there needs to be a description of the what was found in surgery - did the tumor shell out, did it involve a fascicle, and that is why there is a remaining deficit?

Was a nerve gap created and was it grafted? Did they do intraneural dissections?

Then it can be accepted and published
