Reviewer's report

Title: Leg orientation as a clinical sign for pusher syndrome

Version: 4 Date: 7 July 2006

Reviewer: Stefan Glasauer

Reviewer's report:

General

The authors improved the manuscript significantly, and I have only some minor comments left.

---------------------------------------------------------------------------------

Major Compulsory Revisions (that the author must respond to before a decision on publication can be reached)

None

---------------------------------------------------------------------------------

Minor Essential Revisions (such as missing labels on figures, or the wrong use of a term, which the author can be trusted to correct)

As suggested, the authors restricted the body tilt angles to the maximum body tilt angles which were reached by each single participant under both viewing conditions. The range was now -18.3° (contraversive) to 4.3° (ipsiversive) of body tilt. (page 7)

However on page 6 it is mentioned that Data were averaged across the whole tilt range for each tilt direction respectively. This was probably not the case, since it contradicts the later statement on page 7.

Page 7-8: It would be more logical to mention and describe Figure 2 before the paragraph describing average leg-to-trunk orientation in the main text.

Page 13, 3rd line from bottom: performed instead of preformed

---------------------------------------------------------------------------------

Discretionary Revisions (which the author can choose to ignore)

None

What next?: Accept after minor essential revisions

Level of interest: An article whose findings are important to those with closely related research interests

Quality of written English: Acceptable

Statistical review: No
